A scanning tunneling microscope with a high-intensity pulsed laser was designed for measurement of tunnel current-voltage (I-V) characteristics and evaluation of the local surface potential (V(S)) of single crystal surfaces. The present microscope operates on a dual mode of laser-assisted tunneling and scanning tunneling. When a pulsed laser of wavelength 532 nm was focused on a sample, tunneling current was generated between the sample and an electrically sharpened tungsten tip. The tunneling I-V curve was measured under a pulsed and static potential condition. The V(S) was calculated by the difference between the tunnel current and the static potential

What's New in the AutoCAD?

Markup Assist has expanded to provide much-needed context about the feedback and auto-corrections you are importing from a PDF. New tools for efficiently inserting pre-placed text and dimensions to drawings. Improved design efficiency by offering streamlined insertion and scaling for components and views. New ergonomic design features have been added to the autocomplete engine to make editing and creation faster and easier than ever. A variety of new best practices and tips have been added to help you be a more efficient designer. Efficient Design: Model-driven geometry editing: Take your design from existing models to the model-driven editing experience. It's quicker and more intuitive to edit your model-driven geometry in the experience, which lets you focus on design. (video: 8:15 min.) Model-driven editing with Dynamic Components: A new way to apply and edit components. Create and edit your component in the experience, so you don't have to exit the experience to edit the component. (video: 1:14 min.) Using simple snaps, edit your component in the experience, and then reposition it in the design. (video: 3:05 min.) Spatial Data tools: Navigate large drawings using the mouse and keyboard by selecting snap points to see a detailed view of your drawing. This enables you to get to any part of your drawing very quickly. (video: 1:28 min.) Create an assembly in the experience, based on a layer or point set, and automatically apply to other drawings or models. (video: 1:50 min.) Reverse engineering of assembly models is now simpler and more intuitive, making it easier for you to quickly understand and use. (video: 4:08 min.) Find assemblies in the model-driven editing experience, based on layer or snap point selection. (video: 1:47 min.) Model-driven editing works well with CAD products from other manufacturers, since Autodesk® has reverse engineered the Model-driven editing experience for other CAD systems. To make it easier for you to get the most from your
