For example: list_of_integers = [5, 10, 20,..., 100] input: 5 output: True input: 15 output: False I would also like to know how to convert the list into a list of positive

integers. I am currently using something like: if input_number in list_of_integers: # do something Is there a better way to do this? A: I would convert the list to a set, because it removes duplicates, and then use the set.issubset: >>> list_of_integers = [5, 10, 20, 20, 100] >>> set(list_of_integers) set([5, 10, 20, 20, 100]) >>> set(list_of_integers).issubset([15]) True >>> set(list_of_integers).issubset([4]) False If you have a list of positive integers, you can use the following method: >>> list_of_integers = [1, 2, 3, 4, 5, -1, 0, -1] >>> [i for i in list_of_integers if i >= 0] [1, 2, 3, 4, 5] A: If you're using python 2, you can use a generator expression with all() to remove the need for a temporary list: list_of_integers = [5, 10, 20, 50] if all(item >= 0 for item in list_of_integers): # do something Bidirectional influence of enteric bacteria on the gut microbiome. The purpose of this study was to determine the patterns of tibiofemoral and patellofemoral misalignment during total knee arthroplasty (TKA). Three radiographic techniques were used for the measurement of joint alignment: the mechanical axis method, the ratio of femoral to tibial mechanical axis (F/T ratio), and the cross-sectional distance method. Fifty-eight knees from 29 patients with a mean age of 67 years (range, 47-88 years) underwent TKA for osteoarthritis. The mean follow-up time was 43 months (range, 6-85 months). All knees were scored according to the modified American Knee Society (AKS) system. In patients with a mean body mass index (BMI) of 26 kg/m(2) (range, 18-35 kg/m(2)), the mean joint space was 3.1 mm (range, 2-5 mm) and the mean F/T ratio was 0.62 (range, 0.35-0.82). The mean flexion angle was 107 degrees (range, 90-120 degrees). The mean AKS score at the last follow-up was 96 points (range, 93-100 points). After the TKA, the mean AKS score was 95 points (range, 90-100 points). Tibial and femoral bowing deformities were present in 42% of knees and the mean Kellgren-Lawrence score was 1.3 (range, 0-2). There was no correlation between tibiofemoral alignment, patellofemoral alignment, and the AKS score. The F/T ratio
