i7 Turbo Product Key is a software tool that you can use to test the Turbo capabilities of your system. You can view the current CPU multiplier, multiplier thread and CO state, as well as its percentage and average state. You can also set the default load filter and save data to a file. #4 StartupTime - Startup Time Analyzer Version: 1.0.1.1 StartupTime provides a quick and easy way to check which programs start, login, shutdown, and idle during boot and shutdown processes. StartupTime also monitors the autostarting of programs after shutting down. This is a boot log utility that provides a single, consolidated view of all-critical, logged events on startup and shutdown of your machine. This allows you to see the boot sequence in a single graphical representation and to identify and locate the files and Registry entries for any program that is registering information. This is not a program that will cause changes or modifications to your existing registry. It simply allows you to check the program's pre-existing Registry settings and make minor changes as required. The i7 Turbo is a small-sized and portable piece of software that you can use to run benchmarks on your computer in order to test the Turbo throttling. It does not come equipped with too many features or configuration settings, so you can quickly work with it. Portability advantages Since there is no installation involved, you can save the program files to a custom location on the disk and just click the executable to launch i7 Turbo. There is also the possibility to save it to a pen drive or other mass storage device, to be able to run it on any machine with minimum effort and no previous installers. More importantly, it does not modify Windows registry settings or create extra files on the disk without your consent, thus leaving no traces behind after its removal. Simple interface and options The GUI is user-friendly, made from a single window with a plain and simple structure, where the app automatically starts monitoring the computer at initialization. So, you can view the calculated multiplier and multiplier thread along with the C0 state percent and average C0 state, as well as change the default load filter. Information can be logged to file and exported to a CSV file. What's more, the minimum and maximum values can be reset. Evaluation and conclusion There were no stability issues during our tests, since the tool did not hang, crash or pop up error messages. It has a good response time and minimal impact on computer performance. All in all, i7 Turbo delivers a simple solution to test the Turbo throttling of machines. My suggestion would be to work with the default settings for the above run. In order to take the game to the next level, you should try different load filters. Make sure to test the minimum and maximum values to see how the system is affected. You can try with the following load filters: -1 for Game +2 for Music +3 for Video +4 for Pictures -2 for Dev tools -3 for Documents -4 for Software Additionally, you can use my tool below to calculate and monitor the system threads. It can be used to monitor the performance of your Windows system, such as the number of system threads (also known as processes) running at a time, as well as their working status. NOTE: The tool can be used to check the system threads, as well as the working status of each of them, but it cannot be used to have a look at the amount of

1.7 MB Download i7 Turbo and let the benchmarks launch automatically when the computer is booted. Once launched, the program will launch a process to detect performance bottlenecks of all executed applications. i7 Turbo uses as a load filter to select the Core i7 or Core i5 applications to run on the CPU. i7 Turbo Features: # - Multiplier, ratio and thread: The value of C0 state percentage is divided by the value of C0 state average value. This gives the percentage of C0 state allocated to each core. One of the useful features of the tool is that it provides a Multiplier value (0-80) in order to test the potential power savings of each core. - Load Filter (CF parameter): CF stands for Core Function. This parameter represents the selected load filter and it decides the category of the application to be filtered. CF values are CM, AP, FM, ST and WP. - Log file: i7 Turbo logs the performance data, the number of programs detected and the progress bar in a log file with.txt file extension that you can download and analyze later. - Export / import CSV: Export CSV allows you to export data in a text file. You can import the information on different machines and share the results with the rest of your team. Conclusions: i7 Turbo is a simple, straightforward way to evaluate the Turbo throttling of an Intel Core i7 or i5 machine. It is designed as portable software and has a clean GUI structure that allows you to configure its options in a straightforward way. The app runs fast, simple, reliable and stable. It offers good ease of use and allows you to perform basic benchmarks in order to test the Turbo throttling of a machine. If you find the app interesting, please do not hesitate to leave a rating and review for this tool. It is important for our developers to learn what you think of the app so we can improve it accordingly. Added tip: You may also like to consider using Intel SpeedStep Technology, a Windows feature. The application can run several benchmarks to see if you can get more performance from your machine. Download i7 Turbo from our tool archives. (news) Multiple users have reported that the VLC media player on Windows 7 and other platforms running on Intel CPUs is unable to play back video streams after updating the VLC to version 2.2
