a solid-state image pickup device including the light-source device.

2. Description of the Related Art

In recent years, as an increase in the number of pixels in a solid-state image pickup device has led to an increase in demand for high-speed readout of image

information, a solid-state image pickup device is known in which a correlated double sampling (CDS)

is performed for each readout pixel to reduce (smooth) a temporal change in signal level.

For example, there is known a

solid-state image pickup device in which an integration period in which signal level information is read out from a photodiode is divided into two periods. The integration period in the first period is a pre-signal-integration period, and the integration period in the second period is a post
