Celemony.Plugin.VST.RTAS.v1.0.4.2.Incl.Keygen-AiR Category:2008 software Category:Digital audio workstation software Category:Digital audio effects Category:Free software programmed in C++ Category:Linux audio software Category:MacOS audio software Category:Windows multimedia software Category:Windows-only softwareThis invention relates to a process for preparing a sheet form of a thermoplastic polymer. There is an increasing demand for a material with high heat resistance that can be produced inexpensively. Thermoplastic polymers such as polycarbonate (PC), polyethylene terephthalate (PET), polyetherimide (PEI) and polyphenylene sulfide (PPS) are desirable because they have high heat resistance and are relatively inexpensive. However, they are generally brittle. When added to thermoplastic resins such as polyester, they cannot be mixed and molded by ordinary means such as an extruder. The process used to produce a sheet form of thermoplastic polymer normally involves the steps of preparing a polymer granules such as pellets or beads by melt-spinning or solvent extracting, as necessary; and then finely dividing or deflaking the polymer granules in order to produce flaky particles. A flaky particle having a mass of about 10 g to about 100 g is heated at a temperature of about 400.degree. C. to 500.degree. C. to melt it and comminute it into a powder form. The powder is then pulverized and dispersed in water to form a slurry. The slurry is heated at about 80.degree. C. to 100.degree. C. to form a sheet form. When using these conventional methods, it is difficult to obtain a fine powder which is uniformly dispersed in the wet phase. 82138339de
