The current epidemic of obesity, diabetes, and cardiovascular disease has prompted renewed interest in the relationship between hyperglycemia and the vascular system. There has been much debate about the impact of acute hyperglycemia on vascular function and the importance of tight glycemic control. The purpose of this review is to summarize current research that has focused on the acute impact of hyperglycemia on the cardiovascular system. Several studies suggest that acute hyperglycemia acutely impacts vascular function. Recent reports indicate that acute hyperglycemia within the physiologic range of normal glucose tolerance acutely impairs endothelium-dependent vasodilation and platelet aggregation ex vivo and that these changes are associated with a decrease in circulating NO. The observation that these changes can be reversed by insulin infusion suggests that the effect of acute hyperglycemia on vascular reactivity is mediated, at least in part, by increased oxidative stress and decreased NO. There also is evidence that chronic hyperglycemia leads to endothelial dysfunction. Patients with type 2 diabetes have increased vascular tone and impaired endothelium-dependent vasodilation, and these parameters are associated with markers of chronic vascular disease, such as carotid intima-media thickness and the ankle-brachial index. In addition, the prevalence of microvascular disease is three times as great in patients with type 2 diabetes as in nondiabetic individuals. Hyperglycemia is associated with a myriad of changes in the cardiovascular system, many of which are associated with the development of micro- and macrovascular disease. The available data suggest that tight glycemic control during the first 5 years of diabetes may reduce this risk by lowering the incidence of long-term complications.Q: How to use convert to change dd/MM/yyyy to yyyy/MM/dd?
