AutoCAD 2010 includes a new drawing template feature that allows users to re-use commonly used drawings. The template feature allows users to create and modify a library of working drawings and use them instead of drawing from scratch. The new feature, introduced in version 2010, provides a lot of tools to create templates, including the ability to switch between pre-defined templates and the ability to add or delete objects from templates. These objects are saved with the drawing. AutoCAD also supports a system for creating, publishing, and using a drawing template library. Also, templates can be shared with other users. AutoCAD 2010 introduced a completely re-written query system, similar to the WPF interface. The Query windows, with all their familiar windows and controls, are now enhanced with a drag-and-drop interface to quickly add fields and generate queries. A new Query Definition window gives detailed information about the operation being performed on the current document. The new feature supports all the filters and reports available in AutoCAD and can be filtered by drawing objects, objects in the layout, or by filter type. This functionality can be extended in VBA to create filter based queries. AutoCAD 2010 features point cloud data for 3D and 2D drawings. AutoCAD 2010 supports AutoCAD Architecture, which is a Post-Revit architectural drafting software product from Autodesk. AutoCAD Architecture can be used to design with and document the creation of buildings. It supports the specification of features such as roofs, walls, floors, windows and doors. The architectural information is defined in a database. The database contains all the information needed for the drafting of the project. AutoCAD 2010 supports a new graphical user interface that is similar to Microsoft Windows Vista. It is called the new Ribbon interface and has a new set of features. The new interface is the result of extensive user research and is expected to be the mainstream interface in AutoCAD for many years. AutoCAD 2010 includes a new creation process that includes a design workflow feature that uses an integrated modeling application called "Marionette." This feature allows users to work at the level of the design elements
