PROBLEM: I have iMac with Mac OS. I installed Easy Speech2Text. When I want to convert from speech to text, I am asked to choose between the files with the extensions srt and rtx. But the problem is that those two are the same file. So, it is supposed to be easy since it is just a conversion. Please suggest me any command line option to eliminate the confusion. I am sorry about the novice nature of my question. Thank you.

A: It is a problem of the "speech to text" engine that you use. Your "conversion" software (only one choice to use the "text to speech" engine) is using the "classical" format (.srt) (for speech recognition) and not the "rapid" format (.rtx) (for the text to speech engine). You may see this information on the speech2text homepage. So you have to use the speech2text text2speech engine.

As the value and use of information continues to increase, individuals and businesses seek additional ways to process and store information. One option is an information handling system. An information handling system generally processes, compiles, stores, and/or communicates information or data for business, personal, or

---

other purposes. Because technology and information handling needs and requirements may vary between different applications, information handling systems may also vary regarding what information is handled, how the information is handled, how much information is processed, stored, or communicated, and how quickly and efficiently the information may be processed, stored, or communicated. The variations in information handling systems allow for information handling systems to be general or configured for a specific user or specific use such as financial transaction processing, reservations, enterprise data storage, or global communications. In addition, information handling systems may include a variety of hardware and software resources that may be configured to process, store, and communicate information and may include one or more computer systems, data storage systems, and networking systems. Epidemiological trends and genotypes associated with multidrug-resistant *Acinetobacter baumannii* in China. *Acinetobacter baumannii* is a major opportunistic pathogen and an emerging

---

clinical threat with increasing multidrug resistance (MDR). The epidemiological data on MDR *A. baumannii* is rare in China. This study assessed the impact of recent national epidemics, molecular characteristics, and clonal spread
