Elden Ring Features Key:

Customization: You can change a lot of things about the game, such as interface customization, view options, and resource management. You can even customize which aspect of the game you want to be involved in (e.g. Gems, Production, Trading).

Defectives: When you complete a level, you also get an "achievement", which is like a trophy. There are different types of achievements, and completion of them gives you access to different bonuses, such as +2 Production Buildings per Sea (if you can get at least 50 Defectives), or even a free turn per level of your choice (if you can complete at least 5 levels with no Defectives).

Recaps: You cannot only receive achievements, but also achievements to get from the game a couple of times. You get the total amount of these achievements until 20 by default, but you can also have more, even up to 100. The more you have, the more achievements you get when starting a new game, although the amount of achievements you can get per level remains the same.

Also the game lets you trade resources with the crystals on board to gain access to different resources. This can be used to trade resources as currency to get more utilities, or to trade for a

whole different resource with every single resource being able to be traded over and over again!

A great game! Highly recommend it!

I'm not sure if this is an appropriate place to ask. Please feel free to delete this question if it's inappropriate. ===== davidu * Virtualized gaming on Windows has gotten to the point where it is a pretty comparable experience to native linux gaming -- unless you have weird hardware that causes Linux to be a bad experience. I game a lot and have both Windows and linux on my systems at home. I don't buy new HW anymore because it's less about OS and more about what I'm playing at the time. * OpenGL games -- You can get fantastic looking games with OpenGL -- which you'll probably never see in Windows -- even if they cost more. * I'm not sure if you're looking for just a game or a 3D engine, but I find Id's Quake / Quake 2 engine to be pretty good. GAA3 is another good engine. * X-Plane Pro is another freebie that does take some effort to set up, but it's basically a Mac's X-Plane but with all the OpenGL goodness. * Battle for Wesnoth, Tuxpaint, Inkscape, GIMP, Inkscape -- pretty much any open source tools. * I don't know if it's still the case, but sometime a decade ago, you could run Quake and Nexuiz in a straight conversion of the Quake II engine on Linux. * In terms of FreeDos, Dosbox is pretty great ----- hardwaresofton I would go as far as saying that if you want top-end 3d, linux is still a terrible choice. The alternative is perhaps to just try the native
