The Complete Edition of the Logan Turner's Diseases of the Nose and Throat. The stress response as a regulator of apoptosis in the pathogenesis of chronic obstructive pulmonary disease. Chronic obstructive pulmonary disease (COPD) is characterized by an increase in the apoptosis of lung cells. Apoptosis is the final step in the degenerative process of a cell and represents a mechanism of eliminating or degrading irreversibly damaged cells in the lung. It is now clear that a variety of environmental stimuli can induce apoptosis of lung cells. Thus, the interaction of cells with inflammatory mediators and/or proteases produced by inflammatory cells as well as the increase in reactive oxygen species (ROS) and the oxidant stress that occurs in COPD may all play a role in the increased cell death in the lungs. It has been demonstrated that the antioxidant vitamin E and the Nrf2 transcription factor protect cells from a number of diseases and are vital in the response to oxidative stress. In this review we will focus on some of the existing data on the expression of Nrf2 and its relationship with oxidative stress in COPD. We will also review the possible role of vitamin E in the response to oxidative stress and apoptosis and how its deficiency may contribute to the pathogenesis of COPD. Long-term follow-up after esophageal resection. This article reviews the experience with esophageal resections done from 1967 to 1972 and from 1980 to 1985. Patients with an esophageal carcinoma were excluded
