The utility will execute queries in different ways and use different methods to perform its functions. SQObject Features: SQL, ODBC, Oracle, PostgreSQL, MSSQL, JDBC and MYSQL table queries SQL functions can be used on the results of the queries Select, group, order and filter by column names Search and replace strings View the data in CSV (Comma Separated Values) format Show the available columns for the selected row Inspect all the columns contents and their column names Write the data to the stream that is selected or the file specified by the user Preview the queries before execution Script the resulting changes to the database to create new databases Save and load the script with the data tables SQL functions can be used on the results of the queries SQLObject Automatic correction of the table contents SQL, ODBC, Oracle, PostgreSQL, MSSQL, JDBC and MYSQL SQObject Details and User Guide: Download: SQLObject (For Mac OS X 10.8) (AppStore) SQLObject (For Windows XP) (Download) SQLObject (For Windows Vista) (Download) Download (For Windows 7) (Download) SQObject (For Linux) (SourceForge) SQObject (For Linux) (SourceForge) SQObject (For Microsoft Windows XP) SQObject (For Microsoft Windows Vista) SQObject (For Linux) SQObject (For Microsoft Windows XP) SQObject (For Microsoft Windows Vista) SQObject (For Microsoft Windows XP) SQObject (For Microsoft Windows Vista b7e8fdf5c8

SQLeonardo

SQLeonardo is a powerful and easy-to-use database tool for entering SQL queries into the "command" panel. SQLeonardo can read Oracle, Sybase, and Microsoft databases such as Access, MySQL, DB2, Informix, SQL Server and Sybase. What is New in this Release: The major update to SQLeonardo will be the new dataset editor. There is new dataset collection based on SQL commands, including newly supported types of SQL statements. What is new in Version 8: New views for selecting data, collections, and SQL commands. New datasets including: subqueries, Pivot, Group and many others. New advanced collections based on SQL, including Merge, Union, and many others. New reports and dataset data export functions. New dataset filters based on exact or fuzzy search. Ability to search/filter SQL database, using where clause. Ability to pass variables to SQL. Ability to use wildcards in variable. Explore and create SQL SQL statements. Explore and create sql snippets. SQLeonardo has a new powerful dataset editor that allows you to interactively create datasets and SQL queries to be executed against the selected dataset. SQLeonardo provides a fully integrated version of the famous SQL "IN" construct to specify tables, columns, or even database views in the SQL code. You can also use a syntax similar to that of DB2 to specify a table, column, or view, and you can use SQL wildcards to specify a table or column and to specify a range of columns. In addition to the ability to search for and to filter datasets according to query results, SQLeonardo provides a more graphical way to explore and create SQL statements. This new mode supports all the most interesting SQL constructs, including table joins, joins on both sides, unions, and grouping. This new dataset editor also allows you to copy entire datasets as fully-fledged schemas. You can also attach datasets to the database context you are working with. SQLeonardo is aware of the role model, in that SQL commands can be filtered and regrouped according to their own type. For example, you can filter SQL commands by target database. This release includes many other features, including a new advanced collections editor, new datasets and a new powerful dataset editor, improved reports, a database query builder, and more. SQLeonardo is not a general database tool but a tool that lets you solve a

What's New in the SQLeonardo?

The open source database product that is enhancing the functionality of dbMonitor for SQL Server, Oracle, MySQL, Oracle, PostgreSQL and SQLite. Unparalleled database monitoring for SQL Server, Oracle, MySQL, Oracle, PostgreSQL and SQLite. dbMonitor for SQL Server, Oracle, MySQL, Oracle, PostgreSQL and SQLite gives you the power and ease-of-use of a command line utility to analyze and monitor your databases. SQLSMSPro is a powerful command line utility for SQL Server Management Studio (SSMS) that allows you to generate extensive report strings for querying your databases. The report strings generated by SQLSMSPro can be extremely powerful, and they can be combined with conditional operators to make even more powerful queries. A useful addition to this product is the ability to export a report to HTML or RTF. SQLSMSPro is very powerful, very easy to use, and extremely fast. In many ways, it is more powerful than the Windows SQL Server Agent, but unlike the Windows SQL Server Agent it does not have to be run manually. SQLSMSPro makes it possible to select elements of any SQL Server database using a graphical user interface. And that way you can query your databases. The application queries a SQL Server Database by using the stored procedure sp_MSForeachDB, so it can be used with any DBMS supported by SQL Server. SQLSMSPro generates report strings that are a fraction of the size of those generated by SQL Server Management Studio for a similar set of queries. The difference is that SQLSMSPro is a command line tool that uses the SQL Server system resources to the fullest and is therefore considerably faster. SQLSMSPro also has the potential to be vastly more powerful than SQL Server Management Studio if it is used to its full potential. SQLSMSPro has an unusual design. Most programmable tools look similar to SQL Server Management Studio. SQLSMSPro looks like a command line tool. What this means is that it is possible to integrate a form-based user interface into the design of SQLSMSPro. This allows for a very powerful tool with an unusual design and ease-of-use. SQLSMSPro is a cross-platform application and it is supported by SourceForge and the main developer. Also the program is open source and licensed under the GPL. The SQLCOMPTODB project allows you to export data into a RTF
