A: I have just checked and it seems you were correct in your assessment: You need to use some kind of technology in order to encode the data into meta tags for an audio file. You would be correct about that. However, the examples you provided are no longer practical, since the audio files do not have a valid TAG at all. So, what you probably did was just giving them a valid tag for the file name, so they could identify this sound file as an audio clip. The audio industry has a different standard for the format of audio files. It's called MP3 for example and it uses a different method for identifying audio files - it uses a hash to identify files. So, the way to do it is to give them the MP3 format, and include a special tag that will act like a hash. You can also give them a URL pointing to where you can download an audio version that works well with their format. Also, about the length of the audio files, it's not something you can state in the description of your audio file. I have also found that iTunes itself doesn't know what to do about it.

I have a new (less than a week old) cooktop that comes with a gray cast iron pan with a drain pan. I went through the instructions carefully and am thoroughly cleaning the pot and pan. While doing so, is it best to remove the drain pan, or should I just leave it in place? Will it harm the pan if I leave it in place, or should it be removed? A: I have a new (less than a week old) cooktop that comes with a gray cast iron pan with a drain pan. I went through the instructions carefully and am thoroughly cleaning the pot and pan. If you're doing a thorough cleaning, then I would leave it in place. If you're doing a light cleaning, then it's easier to remove the drain pan (it doesn't hurt anything to do so). As an aside, one of the reasons the
