This product does not come with a software CD-Rom.1. Field of the Invention The present invention relates generally to a method of assembling a fuel cell stack in a matrix of similar stacks. More particularly, the present invention relates to a method of assembling a stack having a serpentine electrode structure. 2. Description of the Background Art Solid polymer fuel cells are an attractive source of clean, efficient electricity. A fuel cell is an electrochemical device that combines a fuel such as hydrogen gas and an oxidant such as oxygen gas to produce electricity and water. The term "fuel cell stack" refers to a matrix of fuel cells, or of fuel cell sections, with each cell containing an anode electrode and a cathode electrode separated by an electrolyte. For example, a stack may include a series of bipolar plates separated by an interposed membrane. The bipolar plates may include channels to distribute the fuel and oxidant to the respective electrodes and to conduct the electric current generated by oxidation and reduction reactions occurring at the anode and cathode, respectively. These channels may be formed by machining openings in the plates. FIG. 1 illustrates a prior art fuel cell stack 10 having plates 12 and 14. The stack 10 may be formed by stacking similar stack sections (e.g., sections 16, 18 and 20). Each stack section, e.g., section 16, 18 or 20 includes a set of bipolar plates or substrate sections. The bipolar plates 12 and 14 of adjacent stack sections may be connected to one another by a perforated member 24, i.e., a perforated member may be used for a connecting end 24 of each bipolar plate 14 as shown in FIG. 1. Alternatively, each bipolar plate may be perforated. For example, a bottom section 18 may have no perforated member 24. The perforated member 24 and bipolar plate 14 may be formed by etching openings in the plate 14, perforating the plate 12, and making a perforated plate 12 from that plate 12. The stack sections 16, 18 and 20 may be stacked by laying the perforated plate 14 of each section on the perforated plate 12 of an adjacent section and then pressing them together to form the stack 10. To maximize the efficiency and reduce the time required for assembly, it is desirable to minimize the number of parts required for assembly of the stack. Consequently, the provision of a perforated plate may be an

CDR/M aren't workable with pretty much any *nix unless you have UnixWare or something to do the burning for you. The reason there are no Linux versions of the software is that CD-RW don't actually require burning software. they just require a bit like windows. If you've got *nix, you can write out a back-up disc with "cat /dev/cdrom > disk.txt" posted 2005.11.24.16.53.07 ISFEST Guest posted 2005.11.25.02.02.36 ok here the deal, people love going to the store and buying additional software to import video or make cd cds, what about a burning software that does all that on a single cd for you. I want a cd burner and burner software that is easy to learn and can import video and make cds to store on cdrs at the same time. I want a burner that can be stored in the app that works with nix and windows. If you haven't answered the questions yet, try to answer the questions below: 1. I want
