Android MIDI has been discontinued by the developer, but he currently offers the source code to interested parties. Head over to this forum thread for details. I plan on supporting the emulator in future versions of XNI, so have a look. +:-+ A few months ago I released a small app called Phyano. It allows you to play music using the keyboard of your Android device, or an external MIDI keyboard. The program consists of two parts: a control panel and a client part. The control panel allows you to browse the source (MIDI) files in external SD cards, and load them into the client part. The client part allows you to choose an audio output and input source and tune the sounds based on the relative pitch of the sources and the monitor output to the ear. If you have an Android phone with a microphone, you can use your phone as a microphone, and if you have an Android tablet (with a microphone) or an external USB microphone, you can use that as the audio source. The control panel also allows you to select the MIDI IN and MIDI OUT channels, and display/select the external audio device and format, like the player, mixer, the headphone, etc. You can also configure the output of the sound system from the microphone in the control panel by changing the monitor output from the phone/tablet, and by using a headphone to select the audio output for headphones, analog speaker or both. The client part also allows you to set the internal audio output of the phone/tablet with a headphone, with the monitor output, and only to external audio devices (as the source input), and to change the mixer settings like the volume and pan. In the control panel you can also set parameters for plugins, like the loop length and delay, and also export to MIDI files. XNIRealtime is a small app that gives you real-time control over your audio settings on your phone, including the display screen brightness, which can be a problem with Android devices. The app was written by Roman Zolkolinsky and works with most phones and tablets with Android 1.6 or higher. There's no user interface for this app, as you only use the command line, but it's still very simple. The way it works is similar to the way XnView works, except it's built-in to the OS, and provides

 Installation: To install Phyano, run the following command line: `python setup.py install`  
 Installing under Python 3.2: Python 3.2 has some incompatibilities with Cygwin. You will need to do a bit more work to install Phyano under Python 3.2. You'll need to modify the top section of setup.py as follows: change the "run\_test" line to read `run_test = subprocess.call(["python setup.py test"], stdout=PIPE, stderr=subprocess.PIPE)` You'll also need to change the version string to read `version = "0.1.2"`  
 Click the "Download" button on this page to get the Phyano package for your Python version.  
 Release Notes: 0.1.1 Renamed "0.1.0" to "0.1.0a" Changed the package name for this release to Phyano instead of py. To modify build settings for this, use the win32 version of the setup.py script. Use `win32 = False` to build the python setup.py script or use `win32 = 1` if you want to build the Cygwin setup.py script.
